I have developed a mobile application using Flutter, which I will be deploying on the Play Store. Since Flutter is a cross-platform framework, the same codebase can also be used to build for the web. However, for the web version, we do not upload an APK file. Instead, Flutter generates web assets (HTML, CSS, and JavaScript) that can be deployed on hosting platforms like Firebase, Netlify, Vercel, or GitHub Pages.

below is whole history available :
